

My Dream Home

My "dream home" is a log cabin. I am going to use sticks and leaves to build this log cabin. I am going to use sticks for the logs because sticks are the closest things that resemble logs that are small and sturdy enough for my log cabin. I am going to use a pinecone for a tree that is near by my "dream home". Finally I will use the leaves for the roof of my log cabin.

My log cabin will be built in a beautiful forest in Wyoming. I decided it to be built here because log cabins are found in big forests such as the big forests in Wyoming. I also enjoy the cold environment found in Wyoming; it is much cooler in the year than in Maryland. My dream house will be completely green. What makes my house "green" is the fact that is made from natural resources (logs and leaves). Instead of getting imported logs from around the world I will chop down local trees from around the forest. But most importantly, I will replant a new tree for every tree I chop down.

This log cabin meets many of my accommodations. Since I wouldn't like to have a much different house than what I am used to, the house will be just the right size. The house will not be too big or too small. I also enjoy cozy houses and what could be a cozier house than a log cabin. Log cabins are very similar to other homes we are familiar with. Buildings made of steel, vinyl, and aluminum are built using similar building techniques, they are just made of different materials. The homes we live in are made of lumber, which comes from trees, only more prepared than the rustic logs used in a log cabin.
